AA1MY SUGGESTS.....:

- \* Forget the vertical, -except as a last resort. You don't have a good site.
- \* 1st choice: If at all possible, use a perimeter loop as big as you can.
- \* 2nd choice: A good dipole or "sloper vee", done right. (Ref. handbooks.)
- \* Stay as far away from the aluminum house as possible in all cases; they're not only shields and absorbers, they also can be very noisy in RF.

Remember, QSO's are more often limited by noise than power. (esp. QRP)  
If you're interested in seeking help for optimum choice for your site, provide more detail. (site descript., limitations such as paranoia, vertigo, \$\$...)

Check out your local Jewelry Supply house....not sure where you are located, but they are quite common here in the Southwest.
